

201-06-XX Series Hand Glue Valve

The **HAECO Hand Glue Valve** is a corrosion resistant, stainless steel valve that is mechanically opened with a thumb lever by the operator and is spring closed when the lever is released. It is designed for durability and yet light weight for operator comfort.

There are four standard options available on the outlet port for dispensing a variety of patterns. Three of the options utilize quick disconnect fittings for coupling to the HAECO 302 Series Applicator Heads. The 302 Series Heads (shown above at right)

provide a variety of pattern widths at 1/8" or 1/4" vein spacing. The fourth option provides a single orifice, disposable plastic nozzle (shown above at left).

To compliment the HAECO Hand Valve, a standard 10 foot hose assembly features high flexibility, light weight, crimp guards and swivel fittings to keep the hose from coiling during operation. For the material supply, HAECO offers a variety of pressure tank assemblies or a double diaphragm pump and accessories to provide a complete Hand Gluing System.
